Group rings

Definition

G group, A ring. The group ring is

$$A[G] = \bigoplus_{g \in G} Ag$$

with the product

$$ag \cdot bh = (ab)(gh)$$

 $\forall a, b \in A; g, h \in G$

Pablo Miralles González

CUT groups

•
$$\pm G = \{ trivial units of \mathbb{Z}[G] \}.$$

• $\pm Z(G) = \{ \text{trivial central units of } \mathbb{Z}[G] \}.$

$$\pm Z(G) \subseteq Z(\mathcal{U}(\mathbb{Z}[G])) = \mathcal{U}(Z(\mathbb{Z}[G])).$$

Definition

G is *CUT* (*Central Units are Trivial*) if $Z(\mathcal{U}(\mathbb{Z}[G])) = \pm Z(G)$.

Objective: characterise CUT groups.

Characterisations

Theorem

- G finite group. The following statements are equivalent:
 - G is CUT.
 - **2** $Z(\mathcal{U}(\mathbb{Z}[G]))$ is finite.
 - **③** For each $\chi \in Irr(G)$, $Q(\chi)$ is contained in an imaginary quadratic field.
 - **③** For each $g \in G$ and $j \in \mathbb{N}$ coprime with |G|, $g^j \sim g$ or $g^j \sim g^{-1}$.
 - G is inverse semi-rational.
 - **5** For each $g \in G$, $\mathbb{Q}(g)$ is contained in an imaginary quadratic field.

3

(a)

G finite group. The following statements are equivalent:

- G is CUT.
- **2** $Z(\mathcal{U}(\mathbb{Z}[G]))$ is finite.
- **③** For each $\chi \in Irr(G)$, $\mathbb{Q}(\chi)$ is contained in an imaginary quadratic field.
- For each $g \in G$ and $j \in \mathbb{N}$ coprime with |G|, $g^j \sim g$ or $g^j \sim g^{-1}$.
- **6** *G is inverse semi-rational.*
- For each $g \in G$, $\mathbb{Q}(g)$ is contained in an imaginary quadratic field.
- $(1) \implies (2)$ is obvious.
- $(1) \iff (2)$ based on Berman-Higman's theorem.

Group representations and characters

Definition

F field, *G* group. An *F*-representation of *G* is a group homomorphism $\rho: G \to GL_n(F)$. The character afforded by ρ is

$$\begin{split} \chi: G &\longrightarrow F \\ g &\longmapsto \chi(g) = tr(\rho(g)). \end{split}$$

 ρ and χ can be linearly extended to F[G].

Extended ρ is an *algebra homomorphism*.

Example

• F[G] is an *F*-algebra and an F[G]-module called the *regular* F[G]-module.

Example

- F[G] is an *F*-algebra and an F[G]-module called the *regular* F[G]-module.
- \mathcal{B} *F*-base of *F*[*G*].

Example

- F[G] is an *F*-algebra and an F[G]-module called the *regular* F[G]-module.
- \mathcal{B} *F*-base of *F*[*G*].

$$\lambda : F[G] \longrightarrow End_F(F[G])$$
$$a \longmapsto \lambda(a) = (x \mapsto ax).$$

Example

- F[G] is an *F*-algebra and an F[G]-module called the *regular* F[G]-module.
- \mathcal{B} *F*-base of *F*[*G*].

٩

$$\lambda : F[G] \longrightarrow End_F(F[G])$$
$$a \longmapsto \lambda(a) = (x \mapsto ax).$$

• $\rho(g) := \mathcal{M}_{\mathcal{B}}(\lambda(g))$ is a regular F-representation.

Example

- F[G] is an *F*-algebra and an F[G]-module called the *regular* F[G]-module.
- \mathcal{B} *F*-base of F[G].

$$\lambda: F[G] \longrightarrow End_F(F[G])$$
$$a \longmapsto \lambda(a) = (x \mapsto ax).$$

- $\rho(g) := \mathcal{M}_{\mathcal{B}}(\lambda(g))$ is a regular F-representation.
- ρ affords the *regular character* ϕ .

Example

- F[G] is an *F*-algebra and an F[G]-module called the *regular* F[G]-module.
- \mathcal{B} *F*-base of F[G].

٩

۵

$$\lambda: F[G] \longrightarrow End_F(F[G])$$
$$a \longmapsto \lambda(a) = (x \mapsto ax).$$

• $\rho(g) := \mathcal{M}_{\mathcal{B}}(\lambda(g))$ is a regular F-representation.

• ρ affords the *regular character* ϕ .

$$orall g \in G \quad \phi(g) = egin{cases} 0 & ext{if } g
eq 1; \ |G| & ext{if } g = 1. \end{cases}$$

•
$$\alpha = \sum_{g \in G} a_g g \in \mathbb{Z}[G] \subseteq \mathbb{C}[G], a_1 \neq 0$$

and $\alpha^m = 1$ for some $m \in \mathbb{Z}$.

•
$$\alpha = \sum_{g \in G} a_g g \in \mathbb{Z}[G] \subseteq \mathbb{C}[G], a_1 \neq 0$$

and $\alpha^m = 1$ for some $m \in \mathbb{Z}$.

•
$$\rho(\alpha)^m = \mathsf{Id} \implies$$

 $\exists P : P^{-1}\rho(\alpha)P = \mathsf{diag}(\varepsilon_1, \dots, \varepsilon_{|G|}).$

• Each ε_i is a root of unity, so $|\varepsilon_i| = 1$.

$$\chi \in \mathit{Irr}(\mathit{G}), \mathit{f} = \mathit{e}_{\mathbb{Q}}(\chi)$$

Definition

 $A \mathbb{Q}$ -algebra, \mathcal{O} is an *order* in A iff \mathcal{O} is a subring of A, its additive group is finitely generated and \mathcal{O} contains a \mathbb{Q} -base of A.

Definition

A Q-algebra, \mathcal{O} is an *order* in A iff \mathcal{O} is a subring of A, its additive group is finitely generated and \mathcal{O} contains a Q-base of A.

Theorem

A is a \mathbb{Q} -algebra, $\mathcal{O}, \mathcal{O}'$ orders in A, then:

- $\mathcal{O} \cap \mathcal{O}'$ is an order in A;
- $[\mathcal{U}(\mathcal{O}) : \mathcal{U}(\mathcal{O} \cap \mathcal{O}')] < \infty.$

Thus, $\mathcal{U}(\mathcal{O})$ is finite if and only if $\mathcal{U}(\mathcal{O}')$ is finite.

• $Z(\mathbb{Z}[G])$ is an order in $Z(\mathbb{Q}[G])$.

3

(a)
